#### Publication date and software version

Published 22 June 2016. Based on LibreOffice 5.1.

#### Note for Mac users

Some keystrokes and menu items are different on a Mac from those used in Windows and Linux. The table below gives some common substitutions for the instructions in this chapter. For a more detailed list, see the application Help.

Windows or Linux	Mac equivalent	Effect	
Tools > Options menu selection	LibreOffice > Preferences	Access setup options	
Right-click	<i>Control+click</i> or <i>right-click</i> depending on computer setup	Opens a context menu	
Ctrl (Control)	発 (Command)	Used with other keys	
F5	Shift+೫+F5	Open the Navigator	
F11	<b>∺</b> + <i>T</i>	Open the Styles and Formatting window

## Introduction

HTML capabilities in LibreOffice include saving and exporting existing documents in HTML format.

This chapter describes how to do the following in Writer, Calc, Impress, and Draw:

- Create hyperlinks within a document and to other documents such as web pages, PDFs, and other files.
- Save documents as web pages (HTML documents) and create web pages using the Web Wizard included with LibreOffice.
- Create, edit, and save web pages using Writer/Web.

When creating a document that you plan to deliver as a web page, you need to consider the following:

- In an HTML document, hyperlinks are active (clickable), but other cross-references inserted by LibreOffice are not active links.
- An object such as an image is saved as a separate file. However, if that object has been placed in a frame (for example, with an associated caption), it is not saved and does not appear in the HTML document; instead, the name of the frame appears.

# **Relative and absolute hyperlinks**

Hyperlinks stored within a file can be either relative or absolute.

A relative hyperlink says, *Here is how to get there starting from where you are now* (meaning from the folder in which your current document is saved) while an absolute hyperlink says, *Here is how to get there no matter where you start from*.

An absolute link will stop working if the target is moved. A relative link will stop working if the start and target locations change relative to each other. For instance, if you have two spreadsheets in the same folder linked to each other and you move the entire folder to a new location, an absolute hyperlink will break but a relative one will not.

To change the way that LibreOffice stores the hyperlinks in your file, select **Tools > Options > Load/Save > General** and choose if you want URLs saved relatively when referencing the *File System*, or the *Internet*, or both.

Calc will always display an absolute hyperlink. Do not be alarmed when it does this even when you have saved a relative hyperlink. This 'absolute' target address will be updated if you move the file.

## Note

Make sure that the folder structure on your computer is the same as the file structure on your web server if you save your links as relative to the file system and you are going to upload pages to the Internet.

## Тір

When you rest the mouse pointer on a hyperlink, a help tip displays the absolute reference, because LibreOffice uses absolute path names internally. The complete path and address can only be seen when you view the result of the HTML export (saving the spreadsheet as an HTML file), by loading the HTML file as text, or by opening it with a text editor.

# **Creating hyperlinks**

When you type text (such as a website addresses or URL) that can be used as a hyperlink, and then press the spacebar or the *Enter* key, LibreOffice automatically creates the hyperlink and applies formatting to the text (usually a color and underlining). If this does not happen, you can enable this feature by going to **Tools > AutoCorrect Options > Options** on the menu bar and selecting the **URL Recognition** option.

If you do not want LibreOffice to convert a specific URL to a hyperlink, go to **Edit > Undo Insert** on the menu bar, or press *Ctrl+Z* immediately after the formatting has been applied, or place the cursor in the hyperlink, right-click, and select **Remove Hyperlink** from the context menu.

To change the color of hyperlinks, go to **Tools > Options > LibreOffice > Application colors**, scroll to *Unvisited links* and/or *Visited links*, pick the new colors and click **OK**. Caution: this will change the color for all hyperlinks in all components of LibreOffice; this may not be what you want.

In Writer and Calc (but not Draw or Impress), you can also change the *Internet link* character style or define and apply new styles to selected links.

## **Using the Navigator**

You can insert hyperlinks using the Navigator and this is an easy way to insert a hyperlink to another part of the same document.

- 1) Open the documents containing the items you want to cross-reference.
- 2) Click on the Navigator icon in the Sidebar or press F5.
- 3) Click the triangle to right of the **Drag Mode** icon and select **Insert as Hyperlink** (Figure 1). Note that the Drag Mode icon changes shape depending on the type of insert that was previously selected. The default icon for Drag Mode is to show the Hyperlink icon 📾.

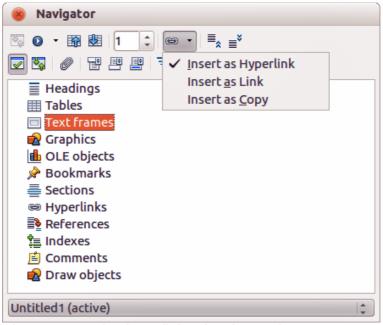

Figure 1: Inserting hyperlink using the Navigator

- 4) Select the document from the drop-down list at the bottom of the Navigator that contains the item that you want to link to.
- 5) In the Navigator list, select the item that you want to insert as a hyperlink.
- 6) Drag the item to where you want to insert the hyperlink in the document. The name of the item is inserted in the document as an active hyperlink.

When using the Navigator to insert a hyperlink to an object such as a graphic, it is recommended to have the hyperlink show a useful name, for example *2009 Sales Graph*. You need to give such objects useful names instead of leaving them as the default names, for example Graphics6, or you will have to edit the name of the resulting link using the Hyperlink dialog, as described below.

You can also use the Navigator to insert a hyperlink from one document (the source) to a specific place in another document (the target). Open the Navigator in the target document and drag the item to the position in the source document where you want the hyperlink to appear.

## **Using the Hyperlink dialog**

You can use the Hyperlink dialog to insert a hyperlink and modify all hyperlinks.

- 1) Highlight the existing text you want to use as a link.
- 2) Click the **Hyperlink** icon on the Standard toolbar or go to **Insert > Hyperlink** on the menu bar to open the Hyperlink dialog (Figure 2).
- 3) On the left side, select one of the four categories of hyperlink:
  - Internet: the hyperlink points to a web address, normally starting with http://.
  - Mail: the hyperlink opens an email message that is pre-addressed to a particular recipient.
  - **Document**: the hyperlink points to another document or to another place in the current document.
  - New document: the hyperlink creates a new document.
- 4) The Hyperlink dialog changes depending on the type of hyperlink selected. Enter all necessary details to create the hyperlink.
- 5) Click **Apply** to create the hyperlink and the Hyperlink dialog remains open allowing you to create another hyperlink.
- 6) Click **Close** to close the Hyperlink dialog.

	Hyperlink	
Internet	Hyperlink Type         • Web       FTP         Target:       Image: I	à
Document	Further Settings Frame: Form: Text 🔗	
New Document	Text: Name:	
Help	OK Apply Close Reset	

Figure 2: Hyperlink dialog showing details for Internet links

The dialog changes according to the choice made for the hyperlink category in the left panel. A full description of all the choices and their interactions is beyond the scope of this chapter. Here is a summary of the most common choices.

- For an *Internet* hyperlink, choose the type of hyperlink (Web or FTP), and enter the required web address (URL).
- For a *Mail* hyperlink, specify the address of the receiver and the subject.
- For a *Document* hyperlink, specify the document path (clicking **Open File** opens a file browser) or leave this blank if you want to link to a target in the same document. Optionally specify the target in the document (for example a specific slide). Click the **Target in Document** icon to open the Target in Document dialog where you can select the type of target; or, if you know the name of the target, you can type it into the box.
- For a *New Document* hyperlink, specify whether to edit the newly created document immediately (**Edit now**) or just create it (**Edit later**). Enter the file name and select the type of document to create (text, spreadsheet, and so on). Click the **Select Path** icon to open a file browser and choose where to store the file.

The *Further settings* section in the bottom right part of the dialog is common to all the hyperlink categories, although some choices are more relevant to some types of links.

- **Frame** value determines how the hyperlink will open. This applies to documents that open in a Web browser.
- **Form** specifies if the link is to be presented as text or as a button. See the *Writer Guide Chapter 15 Using Forms in Writer* for more information.
- **Text** specifies the text that will be visible to the user. If you do not enter anything here, LibreOffice uses the full URL or path as the link text. Note that if the link is relative and you move the file, this text will not change, though the target will.
- **Name** is applicable to HTML documents. It specifies text that will be added as a NAME attribute in the HTML code behind the hyperlink.
- **Events**: click this icon to open the Assign Macro dialog and select a macro to run when the link is clicked. See *Chapter 13 Getting Started with Macros* for more information.

## **Editing hyperlinks**

To edit an existing link:

- 1) Click anywhere in the hyperlink text.
- Click the Hyperlink icon on the Standard toolbar, or go to Edit > Hyperlink on the menu bar, or right-click and select Edit Hyperlink from the context menu. The Hyperlink dialog opens.
- 3) Make your changes and click **Apply** to save your changes. The Hyperlink dialog remains open, allowing you to continue editing hyperlinks. Click **Apply** after editing each hyperlink.
- 4) When you are finished editing hyperlinks, click **Close**.

The standard (default) behavior for activating hyperlinks within LibreOffice is to use *Ctrl+click*. This behavior can be changed in **Tools > Options > LibreOffice > Security > Options** by deselecting the option **Ctrl-click required to follow hyperlinks**. If clicking in your links activates them, check that page to see if the option has been deselected.

#### **Removing hyperlinks**

You can remove the link from hyperlink text and leave just the text by right-clicking on the link and selecting **Remove Hyperlink** from the context menu. You may then need to re-apply some formatting to match the text with the rest of your document.

To erase the link text or button from the document completely, select it and press the *Backspace* or *Delete* key.

## Exporting web pages using the Web Wizard

You can use the Web Wizard to create several types of standard web pages from all LibreOffice components except Math. Each time you start the Web Wizard in a LibreOffice component, Writer automatically starts before the Web Wizard opens. The Web Wizard is linked to Writer and is normally used in Writer for creating web pages.

1) Go to File > Wizards > Web Page on the menu bar to open the Web Wizard dialog.

😣 Web Wizard		
<u>Steps</u>	Introduction	
<ol> <li>Introduction</li> <li>Documents</li> <li>Main layout</li> <li>Layout details</li> <li>Style</li> <li>Web site information</li> <li>Preview</li> </ol>	This Web Wizard is to aid you in publishing documents on the Internet. It will convert the documents so that they can be viewed by a web browser. In addition, it will generate a Table of Contents page with links for easy access to the documents. The Web Wizard will also allow you to customize the design and layout of your web site You will be able to keep the documents you have published on the web up-to-date and add or remove documents at any time.

## Saving and exporting documents as web pages

The easiest way to create HTML documents in LibreOffice is to start with an existing document. You can get a good idea of how it will appear as a web page by using **View > Web Layout**. However, web layout view does not show you which features will or will not be saved correctly in HTML format. Refer to "Relative and absolute hyperlinks" on page 4 on what to consider before creating a web page from a document.

#### Writer documents

#### Single web page

To save a document as a single web page (HTML format), go to **File > Save As** on the menu bar and specify **HTML Document (Writer)** as the file type or **File > Export** and specify **XHTML** format as the file type.

## Note

Writer does not replace multiple spaces in the original document with the HTML code for non-breaking spaces. If you want to have extra spaces in your HTML file or web page, you need to insert non-breaking spaces in LibreOffice. To do this, press *Ctrl+Spacebar* instead of just *Spacebar*.

#### Series of web pages

Writer can save a large document as a series of web pages (HTML files) with a table of contents page.

- 1) Decide which headings in the document should start on a new page and make sure all those headings have the same paragraph style (for example, Heading 1).
- 2) Go to **File > Send > Create HTML Document** on the menu bar to open the Name and Path of the HTML Document dialog (Figure 10).

Name and Path of the HTML Document						
/Users/jean/Doc	uments/Documents/LibreOffice/Getting Started 5.0	<b>`</b>	Server	s	~ ~	
Places	Name 🛆	Туре		Size		Date
My Document Dropbox Downloads Desktop LibreOffice Pictures	ts 🛅 Older drafts	Folder				01/2!
+ -						
File name: I			_		Sav	re
File type:	ITML Document		_	•	Can	cel
separated by:	Dutline: Level 1		_	•	Hel	p
	name extension					

Figure 10: Creating a series of web pages from one document

- 3) Type the file name to save the pages under.
- 4) Specify which style indicates a new page by using the Styles drop-down list at the bottom of the dialog (for example, Heading 1).
- 5) Click **Save** to create the multi-page HTML document. The resulting HTML files conform to the HTML 4 Transitional standard.

#### **Calc spreadsheets**

Calc can save files as HTML documents by going to **File > Save As** on the menu bar and select **HTML Document (Calc)** format as the file type. This is similar to "Single web page" above.

If the file contains more than one sheet and the web pages are created using the Web Wizard (see "Exporting web pages using the Web Wizard" on page 8), the additional sheets will follow one another in the HTML file. Links to each sheet will be placed at the top of the document.

Calc also allows the insertion of links directly into the spreadsheet using the Hyperlink dialog. See "Creating hyperlinks" on page 5 for more information on hyperlinks.

### **Impress presentations**

Saving as web pages in HTML format does not retain animation and slide transitions.

Impress presentations cannot be saved in HTML format, but have to be exported as HTML documents. Note that you can click **Create** at any step in the following procedure. The web pages created will then use the default settings that you have not changed in any way.

- 1) Go to **File > Export** on the menu bar and specify the file name and location of where to save the web page version of your presentation.
- 2) Select **HTML document (Impress)** as the file type and click **Save** to open the HTML Export dialog (Figure 11).

8 HTML Export	
Assign design          New design         Existing design         Test Web Page	Delete Selected Design
Select an existing design or create a new one	
Help Cancel << Back	Ne <u>x</u> t >> <u>C</u> reate

Figure 11: HTML Export dialog - Assign design page

- 3) On the Assign design page, you can choose to create a new design and select or delete an existing design. Specify a New design or an Existing design and click Next >>. If you have not previously saved a web page design, the Existing Design choice is not available.
  - New design creates a new design in the next pages of the Wizard.

- Existing design loads an existing design from the design list to use as a starting point for the steps that follow. The list box displays all existing designs.
- Delete Selected Design deletes the selected design from the design list. If you delete a
  design, you will only delete the design information. An export file will not be deleted by
  this action.
- 4) Specify the *Publication type* for the web pages (Figure 12), then click **Next>>**. The publication type defines the basic settings for the intended export. The choices are:
  - Standard HTML format creates standard HTML pages from export pages.
  - Standard HTML with frames creates standard HTML pages with frames. The exported page will be placed in the main frame and the frame to the left will display a table of contents in the form of hyperlinks.
  - Automatic creates a default HTML presentation as a kiosk export in which the slides are automatically advanced after a specified amount of time.
  - WebCast in a WebCast export, automatic scripts will be generated with Perl or ASP support. This enables the speaker (for example, a speaker in a telephone conference using a slide show on the Internet) to change the slides in the web browsers used by the audience.

For more information on the options available for this page of the HTML Export dialog, click **Help** to open the help pages.

🛞 HTML Export	
Publication type	Options
Standard HTML format	Create title page
○ Standard HTML with <u>f</u> rames	Show notes
○ <u>A</u> utomatic	
○ <u>W</u> ebCast	
<u>H</u> elp <u>C</u> ancel	<< Back <u>Next</u> >> <u>C</u> reate

Figure 12: HTML Export dialog – Publication type page

- 5) Specify the options for *Save graphics as*, *Monitor resolution*, and *Effects* used for the web pages (Figure 13), then click **Next>>**. The options for this page of the HTML Export dialog are as follows:
  - Save graphics as determines the image format. You can also define the compression value for the export.
  - Monitor resolution defines the resolution for the target screen. Depending on the selected resolution, the image will be displayed in a reduced size. You can specify a reduction of up to 80% from the original size. When selecting a resolution, consider what the majority of your viewers might be using. If you specify a high resolution, then a viewer with a medium-resolution monitor will have to scroll sideways to see the entire slide, which is probably not desirable.
  - Effects specifies whether sound files defined as an effect for slide transitions are exported and whether any hidden slides are exported.

For more information on the options available for this page of the HTML Export dialog, click **Help** to open the help pages.

8 HTML Export		
Save graphics as	Monitor resolution

<u>V</u> isited Link	Visited link		
Help     Cancel     <     Next >>     Create			

Figure 16: HTML Export dialog – color scheme page

- 10) Click Create.
- 11) If you have created a new design for your web pages, type in a name for your design and click **Save**.

## Note

Depending on the size of your presentation and the number of graphics it contains, the HTML export function creates several HTML, JPG, and GIF files. It is recommended to create a folder to hold all the files created for the web version of your presentation. If you simply save to your desktop and not in a specific folder, these separate HTML and graphics files will be placed all over your desktop.

## **Draw documents**

Draw documents cannot be saved in HTML format, but have to be exported as HTML documents. Exporting drawings as web pages from Draw is similar to exporting a presentation from Impress. Go to **File > Export** and select **HTML Document (Draw)** as the file type, then follow the procedure above for exporting Impress presentations.

## Creating, editing, and saving web pages using Writer/Web

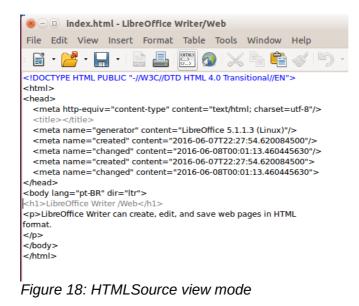

LibreOffice Writer can create, edit, and save web pages in HTML format using a configuration called Writer/Web.

Figure 17: Web display mode for Writer/Web

## Writer/Web display modes

In addition to the Normal and Web display modes for editing (Figure 17), Writer/Web has a third editing mode called HTML Source mode (Figure 18). With the HTML Source mode, you can directly edit HTML tags such as , , and so on to compose web page elements. In that mode you must know the HTML markup language.

You normally add content to an HTML document using the Web display mode, because it will render the contents as if displayed in a browser. Use the HTML Source editing mode to tweak the formatting.

Because HTML markup language has fewer formatting possibilities than a text document in OpenDocument Format, Writer/Web cannot provide all formatting features for HTML documents and some formatting dialogs have fewer options available. For example, an HTML paragraph has no tab settings.

## **Creating and editing an HTML document**

To create an HTML document, choose **File > New > HTML Document**. Writer/Web opens a blank document in web display mode. You can now add content to the document by typing or pasting text, images, tables, and other objects. Use all the Writer/Web formatting resources including styles to format the content. When you have finished, save the document with the HTML file type.

If you need to add HTML content directly into the document, enter HTML Source editing mode by clicking the **HTML Source** icon on the toolbar or choosing **View > HTML Source** from the menu bar. In that mode, Writer/Web turns into a notepad-like text editor (Figure 18).

# 👂 Note

The HTML markup content generated by Writer/Web is limited to the production of a displayable document in a web browser. It does not consider other components of a website such as external cascading style sheets (CSS), external javascript, or other script languages. Use the HTML Source mode to manually insert links to these external components into the page.

## Checking a web page in a browser

It is important to check your web pages (HTML documents) in a web browser such as Mozilla Firefox, Google Chrome, Microsoft Edge, or Safari. Not all browsers render HTML files the same way, so if possible, check the contents in several browsers.

To make LibreOffice open your default web browser and display the contents of a document, go to **File > Preview in Web Browser**. You can also open any web browser and then open the HTML file in it.
